Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

-!- FUNCTION: In the elongating spermatids of mammals, the conversion of nucleosomal chromatin to the compact, nonnucleosomal form found in the sperm nucleus is associated with the appearance of a small set of basic chromosomal transition proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Kleene K.C., Borzorgzadeh A., Flynn J.F., Yelick P.C., Hecht N.B.; "Nucleotide sequence of a cDNA clone encoding mouse transition protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              MEDLINE=88252150; PubMed=3382664; DOI=10.1016/0167-4781(88)90013-9;

Antimicrobial peptides for potentiating antimicrobial agents active against bacteria and fungi.

Disclosure, Page 109; 166pp; English.

activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZBXEXB and its derivatives selected from XZBBZBXEXB, BXZXZB, XBBXZXBX and BBXZBBXZ; and (b) a second peptide template XBBX and their derivatives selected from the group consisting of XBBXBBX, BBXZXBX, XBBXZBB, and (b) a second peptide template XBBX and their derivatives selected from the group consisting of XBBXBBX, BBXZXBX, BXXBXXB, XBBXZBB, and XBBZXXBBXXZBBX; where B = at least one positively charged amino acid; X = at least one aromatic amino acid; and where B, X and Z may be separated by one or more other amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides also increase the antimicrobial activity of The present invention describes an antimicrobial peptide (AP) for direct

been considered to have undesirable toxicity, immunogenicity and short half-lives due to biodegradation. The peptides of the present invention are based upon natural antimicrobial peptides that have potent and broad spectrum activity against pathogens exhibiting multiple antibiotic resistance. They exhibit lower inherent mammalian cell toxicities and overcome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, reteaining activity in plasma and serum. The present sequence is a rabbit PMP based antimicrobial peptide

3

```
The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-150 amino acid core sequence (derived from 150 amino acid core sequence (derived from PMP-1 and PMP-2, platelet microbiocidal protein), and retromers, truncations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also included are (1) an antimicrobial peptide composition for direct activity or for potentiating antimicrobial agents active against organisms such as core sequence selected from truncations of the peptides described above, and retromers, extensions, combinations and fusions; and (2) antimicrobial peptides for potentiating antimicrobial activity of antimicrobial peptides are useful as individual activity of leukocytes against organisms such as bacteria and fungi. The antimicrobial peptides are useful as individual antimicrobial agents that enhance, potentiate or restore efficacy of conventional antimicrobials, agents that enhance, potentiate or restore efficacy of functions of leukocytes, as disinfectants or preservatives for use in foods and cosmetics and as agents to improve efficiency of molecular biology techniques. Antimicrobial peptides of prior art have generally
                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting
neutrophils. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. AAY57463 to AAY57557 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Antimicrobial; platelet microbiocidal protein; PMP-1; PMP-2; bacterial infection; fungal infection; fungicide; disinfectant; preservative; foods; cosmetic; multiple antibiotic resistance; rabbit;

The present invention describes an antimicrobial peptide (AP) for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZBXENSB and its derivatives selected from XZBBZBXENSB, BXZXZB, XBBXZXBB and its derivatives selected from the group consisting of XBBXBBX, XBBXXENS, XBBXZXBB, and (b) a second peptide template XBBXX and their derivatives selected from the group consisting of XBBXBBX, XBBXXENSB, BXXBBXB, ABBXZBBX; and (b) a separated and acid; X = at least one non-polar hydrophobic amino acid; Z = at least one aromatic amino acid, and where B, X and Z may be separated by one or more other amino acids. The peptides can be used to treat bacterial and fungal confections. The peptides leffect cellular disruption and rapid apoptosis of microbial cells. ANSTAGS to AANSTAST represent sequences used in the exemplification of the present invention

The invention trainers to an antimutional peptide comprising a peptide of 5-
150 amino acids containing a 7-13 amino acid core sequence (derived from
PMP-1 and PMP-2, platelet microbiocidal protein), and retromers,

truncations, extensions, combinations, fusions and their derivatives. The
possible structures are fully described in the specification. Also

cricleded are (1) an antimicrobial peptide composition for direct activity

or for potentiating antimicrobial agents active against organisms such as
bacteria and fungi comprising a peptide of 13-74 containing an amino acid

core sequence selected from truncations of the peptides described above,
and retromers, extensions, combinations and fungion and activity of
antimicrobial peptides for potentiating antimicrobial agents,
antimicrobial peptides are useful as individual antimicrobial agents,
cantimicrobial peptides are useful as individual antimicrobial agents

cantimicrobial peptides are useful as individual antimicrobial agents,
conventional antimicrobials, agents that enhance the antimicrobial

conventions of leukocytes, as disinfectants or preservatives for use in

conventions of leukocytes, as disinfectants or preservatives for use in

consequence and cosmetics and as agents to improve efficiency of foods and cosmetics and as agents to improve efficiency of molecular

The invention features to an antimatical peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-
150 amino acids containing a 7-13 amino acid core sequence (derived from peptide and peptide). Also and peptides composition, and extoners, truncations, extensions, combinations, funions and their derivatives. The possible structures are fully described in the specification. Also concluded are (1) an antimicrobial peptide composition for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi comprising a peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above, and retromers, extensions, combinations of the peptides described above, and retromers, extensions, combinations and fungi. The entimicrobial peptides for potentiating antimicrobial activity of antimicrobial peptides are useful as individual antimicrobial agents, agents useful as individual antimicrobial agents, specifically against bacteria and fungi, agents in combination with other conventional antimicrobials, agents that enhance the antimicrobial functions of leukocytes, as disinfectants or preservatives for use in foods and cosmetics and as agents to improve efficiency of molecular conventional antimicrobial peptides of prior art have generally been considered to have undesirable toxicity, immunogenicity and short are based upon natural antimicrobial peptides of the present invention are based upon natural antimicrobial peptides that have potent and broad spectrum activity against pathogens exhibiting multiple antibiotic creatstance. They exhibit lower inherent mammallan cell toxicities and companies of toxicity, immunogenicity, and schotterial and companies of toxicity, immunogenicity, and schotterial and companies of toxicity, immunogenicity, and schotterial and companies of coxicity, immunogenicity, and schotterial and companies of coxicity, immunogenicity, and schotterial or resistence or preserve 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting multiple antibiotic resistance.
                                                                                                                                                                                                                                                                                                                           Antimicrobial; platelet microbiocidal protein; PMP-1; PMP-2; bacterial infection; fungal infection; fungicide; disinfectant; preservative; foods; cosmetic; multiple antibiotic resistance; rabbit;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      invention relates to an antimicrobial peptide composition for use
